- Big O = SELECT operation is denoted by $\sigma_{\text{selection condition}}(R)$ where σ (sigma) denotes the SELECT operator and the selection condition is a Boolean expression specified on the attributes of relation R.
- Pie = PROJECT Denoted by $\pi_{\text{cattribute list}}(R)$ where π (pi) represents the PROJECT operation and is the desired sub list of attributes from the relation R
 - Duplicate Elimination does not output (removes) duplicate tuples
- Union = U
 - Find all cities that are a current city or a HomeTown for some user

RegularUser						RESULT
Email	Birth Year	Sex	CurrentCity	HomeTown		San Francisco
user4@gt.edu	1988	М	San Francisco	Atlanta	7	Las Vegas Dallas
user9@gt.edu	1988	F	Las Vegas	Atlanta	1	College Park
user10@gt.edu	1986	М	Dallas	Dallas		Atlanta
user12@gt.edu	1974	F	College Park	Austin		Austin

- Intersection = ∩
 - o Find all cities that are a currentCity for someone and a HomeTown for so RegularUser
 - $\pi_{ ext{CurrentCitv}}$ (RegularUser) $\cap \pi_{ ext{HomeTown}}$ (RegularUser)

Email	Birth Year	Sex	CurrentCity	HomeTown
user4@gt.edu	1988	М	San Francisco	Atlanta
user6@gt.edu	1988	F	San Diego	San Francisco
user9@gt.edu	1988	F	Las Vegas	Atlanta
user10@gt.edu	1986	M	Dallas	Dallas

o SF is a part of both, appears in result, Same as Dallas.

OPERATION	PURPOSE	NOTATION
SELECT	Selects all tuples that satisfy the selection condition from a relation <i>R</i> .	$\sigma_{< selection \ condition>}(R)$
PROJECT	Produces a new relation with only some of the attributes of <i>R</i> , and removes duplicate tuples.	$\pi_{\text{}}(R)$
THETA JOIN	Produces all combinations of tuples from R_1 and R_2 that satisfy the join condition.	$R_1 \bowtie_{< \text{join condition}>} R_2$
EQUIJOIN	Produces all the combinations of tuples from R_1 and R_2 that satisfy a join condition with only equality comparisons.	$R_1 \bowtie \langle \text{join condition} \rangle R_2$, OR $R_1 \bowtie \langle \text{join attributes 1>} \rangle$, ($\langle \text{join attributes 2>} \rangle R_2$
NATURAL JOIN	Same as EQUIJOIN except that the join attributes of R_2 are not included in the resulting relation; if the join attributes have the same names, they do not have to be specified at all.	R_1^* <poin condition=""> R_2, OR R_1^* (<poin 1="" attributes="">), (<poin 2="" attributes="">) R_2 OR R_1^* R_2^*</poin></poin></poin>
UNION	Produces a relation that includes all the tuples in R_1 or R_2 or both R_1 and R_2 ; R_1 and R_2 must be union compatible.	$R_1 \cup R_2$
INTERSECTION	Produces a relation that includes all the tuples in both R_1 and R_2 ; R_1 and R_2 must be union compatible.	$R_1 \cap R_2$
DIFFERENCE	Produces a relation that includes all the tuples in R_1 that are not in R_2 ; R_1 and R_2 must be union compatible.	$R_1 - R_2$
CARTESIAN PRODUCT	Produces a relation that has the attributes of R_1 and R_2 and includes as tuples all possible combinations of tuples from R_1 and R_2 .	$R_1 \times R_2$
DIVISION	Produces a relation $R(X)$ that includes all tuples $t[X]$ in $R_1(Z)$ that appear in R_1 in combination with every tuple from $R_2(Y)$, where $Z = X \cup Y$.	$R_1(Z) \div R_2(Y)$

**1st ping

Correct Mapping Of

Voted relationship	Voted(Name, BillNumber, How)
DISTRICT entity	District(DNum, SName)
COUNTY entity with its associated relationships, via foreign keys, to a relation then how many non-NULL foreign keys will the relation have	2
map the COUNTY entity with its associated relationships via foreign keys, then which of the following statements will be true about the County relation?	The relation will have two columns associated with the SName of STATE.
create one relation to represent the combination of the Voted and Sponsored relationships?	No

**Second image

Item relation	ItemID and UnitPrice is a superkey
	ItemID is primary

violate the referential	Insert 45 103 2011-05-21 Null into Order
integrity constraint	

Statement about null values - a tuple in the OrderDetail relation cannot have a null value for ItemID

True	False
Several attributes in a relation may have the same domain	
From the mathematical definition of a relation, reordering of tuples does not change the relation state	
The relation state would change more frequently than the relation schema.	

OID 44 – Deletions are propagated - only two tuples from OrderDetail must be deleted

Single tuple w/ value of 5:	UnitPrice(ItemID=1(Item))
	QOnHand(ItemID=4(Item))
	QOrdered(ItemID>2 and OID >43(OrderDetail))
How many -> ItemID(OrderDetail)	4
How many - >	9
Customer*Order*OrederDetail*Item	
OID(Order)XItemID(Item))-	11
(OID,ItemID(OrederDetail)	
Right outer join between	10
OrderDetail(left) and Item(Right)	
customers' Id and Phone number for	(CID(Customer)-(CID(Order)))*(CID,Phone(Customer))
customers who dont have any orders	

Same Relation Produced:

True	False
OrderDetail.OID=Order.OID(OrderDetail X Order)	OrderDetail OrderDetail.OID=Order.OID Order
	OrderDetail * Order

Returned By Query

CID(Customer) – CID(Order)	(1)a relation with one column and two tuples whose values are 102 and 106 (2)a relation with IDs of customers who did not place any orders
Cname(Qordered>3(Order*OrderDetail*Customer)	Brown, Smith
Customer-((CID(Date='2011-06-	returns the CID, Cname, Phone and City of
02'(Order)))*Customer)	customers who did not place an order on 2011-06-02
OID((OID(Order)XItemID(Item))-	returns the OID of orders that dont include all
(OID,Item(OrderDetail)	items from the Item relation
OID = 44	(1)OID(CID=105 Order*OrederDetail)
	(2)OID(OrderDetail)-OID((CID<105 Order)
	(3)OID(QOredered>4 and
	ItemID=3(OrderDetail))
{CID, c.Cname Customer(c) AND (Ed)(Order(d) and	(1)Is writted using tuple calculus
d.Date='2011-06-02' AND c.CID=d.CID)}	(2)105 Brown
{d.OID, d.ItemID OrderDetail(d) AND (Et)(Item(t)	finds the OID, ItemID pairs where item is
and d.ltemID=t.ltemID AND	ordered for a quantity that
d.QOrdered=t.QOnHand)}	equals the quantity on hand.
Left outer join – customers and order, Customers	(1)include customer Doe and Green
is left operand and Orders is right operand.	(2)6 tuples in result

END
